

(e,e'p) acceptance MAP for e4nu

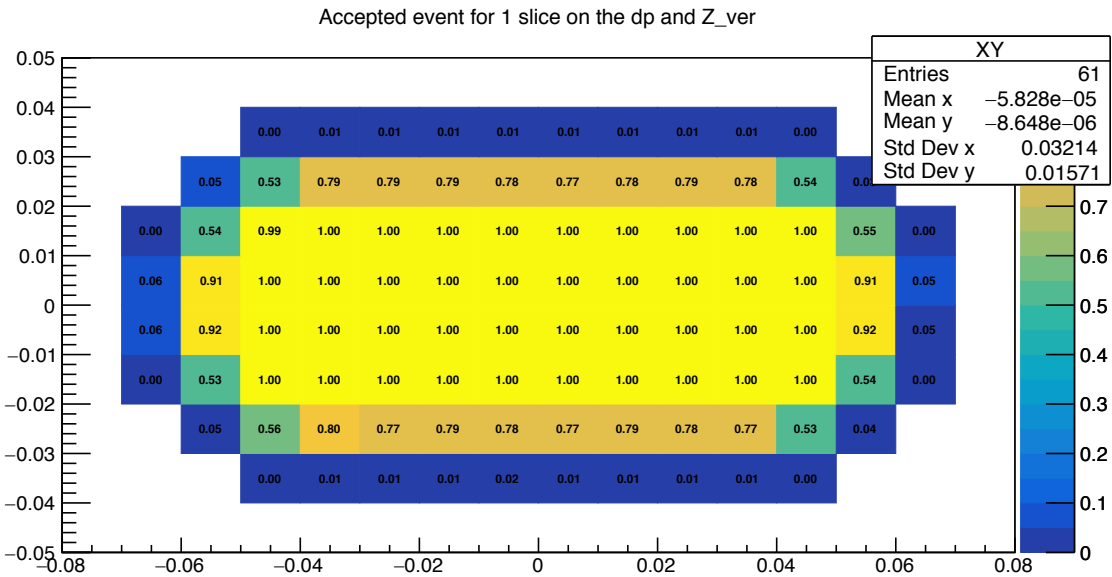

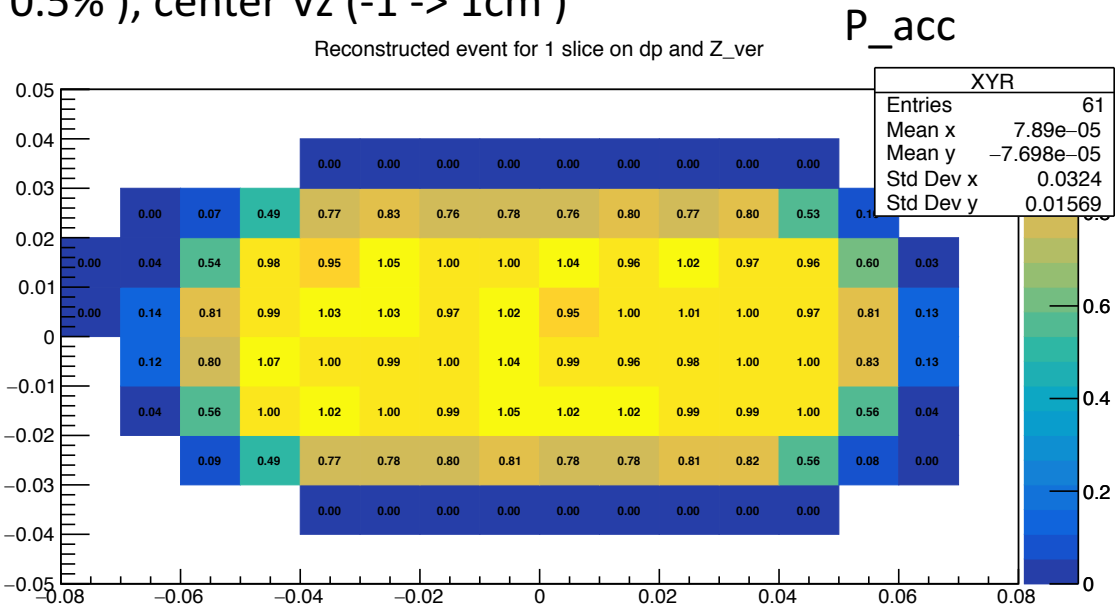

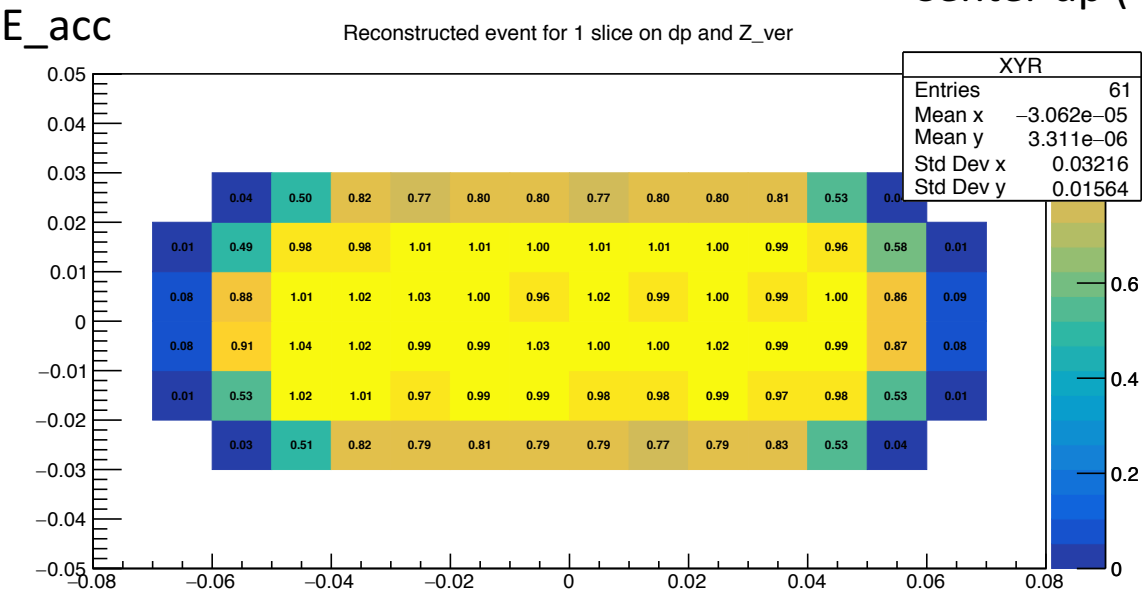

- Data: Hydrogen (e, e'p) from the Tritium data
- Using the single arm simc to simulate the acceptance map for electron and proton separately
- For electron arm: uniformly generated (delta, xp, yp, z_vertex): 4D map:
- For proton arm: Uniformly generated (delta, xp, yp, z_vertex): 4D map
- Acceptance for each 4D bin defined as: N_{recon}/N_{gen} ? Or $N_{accepted}/N_{gen}$?

How to apply to the data:

- For every coinc event (e, e'p) in Hydrogen data: have to apply the cuts to make sure particle e (p) are accepted in both arm
- Check e(delta, xp, yp, Z_vertex) for that event on E_arm -> get E_acceptance
- Check p(delta, xp, yp, z_vertex) for that event on P_arm -> get P_acceptance
- => Total weighting acceptance for that event = $E_acceptance * P_acceptance$

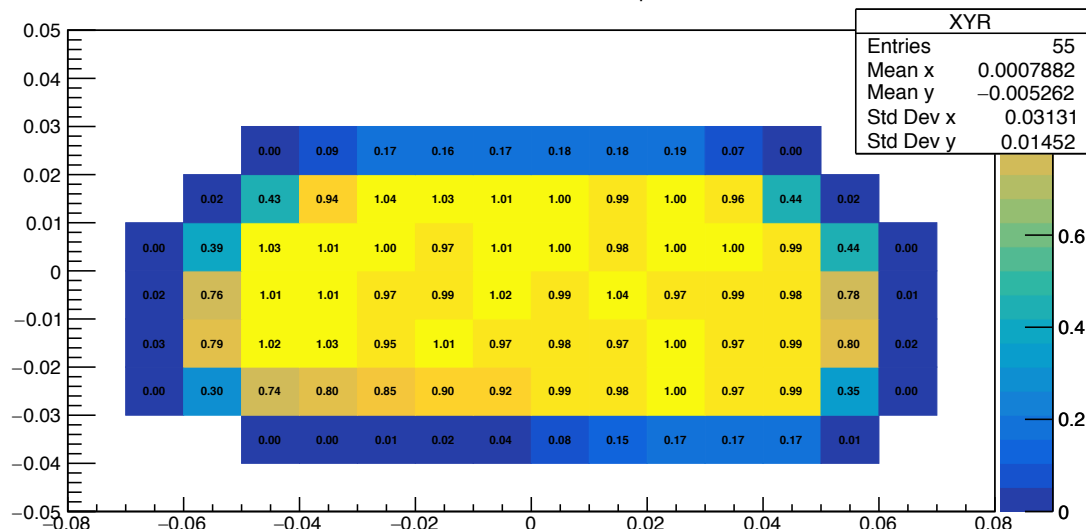

Check the e_acc and p_acc for a slides of dp, Vz

Center dp (-0.5 -> 0.5%), center Vz (-1 -> 1cm)

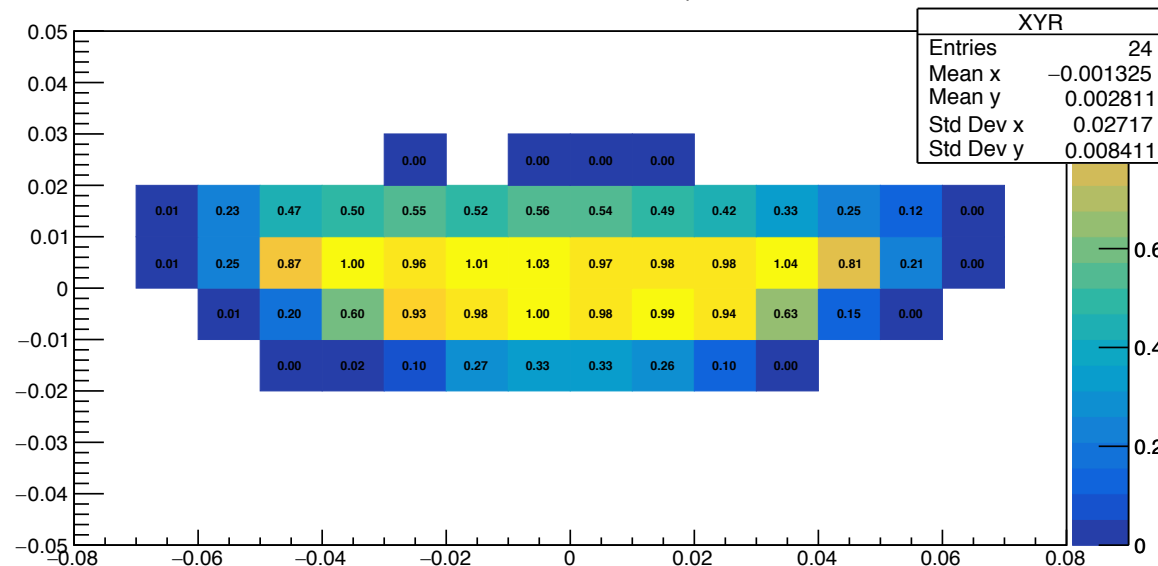

Center dp (-0.5 -> 0.5%) and Vz (-9 cm -> -7 cm)

Reconstructed event for 1 slice on dp and Z_ver

Reconstructed event for 1 slice on dp and Z_ver

Accepted event for 1 slice on the dp and Z_ver

Accepted event for 1 slice on the dp and Z_ver

Center dp (-0.5 -> 0.5) and VZ (7 -> 9 cm)

Reconstructed event for 1 slice on dp and Z_ver

Reconstructed event for 1 slice on dp and Z_ver

Accepted event for 1 slice on the dp and Z_ver

Accepted event for 1 slice on the dp and Z_ver
